## **DETAILED ACTION**

### ***Allowable Subject Matter***

1. Claims 1 and 2 are allowed.
2. The following is an examiner's statement of reasons for allowance: The primary reason for allowance is the requirement that a first silicide layer be formed at an interface between the isolation film and the impurity junction region. The prior art of record suggests several configurations in which the silicide layer is near the interface between the two regions (U.S. 6,383,877 to Ahn et al.) and several configurations in which the silicide is near each region, but the two regions don't have an interface (U.S. 2002/0142552 to Wu or U.S. 6,017,801 to Youn). The prior art provides no suggestion, however, of disposing a silicide at or along the interface, or in other words, at or along a surface of intersection between the impurity junction and the isolation film. The prior art further doesn't suggest a "first silicide layer" at the interface and a "second silicide layer" over the impurity junction and gate, but rather, the prior art simply teaches a single silicide film that approaches an area near the interface.

Since the silicide film at the interface is specifically used by the applicant to minimize the resistance of the impurity junction and improve the operating characteristics of a high-speed device, and since the prior art generally teaches away from providing a silicide along an interface between a substrate and an isolation film, due to leakage problems (see U.S. Patent No. 6,432,797 to Cha et al.), it is the examiner's opinion that a person skilled in the art would have had no motivation for providing a silicide film at the interface between an impurity junction and an isolation film.
